

WEEK 6_REFLECTION

I learned about the Client-Side Storage and API Integration with JavaScript. I learned to use the Local Storage and Session Storage to save the user data, fetching the real-time weather data, displaying the map locations and getting the public user information using the GitHub API. And also learned about how the JavaScript can connect all these features to create a dynamic and interactive webpage. The challenge that is encountered was combining all the features into one well-structured and organized webpage.

It is also challenging to make sure the APIs and storage features worked properly with the design. I solved it by working the features step by step and testing it in the browser, I also adjusted the layout and code several times to make sure everything was properly organized and functional. The improvement that I made is organizing the webpage and making the section separated so that the layout can be understood and use.
