

WEEK 4_REFLECTION

I learned about the JavaScript and making it an interactive and responsive to user actions. I also learned to add the current time, switch between dark and light modes, add and remove tasks, respond to key events, and display a modal when submitting a form. I also learned about the local storage and the use of DOM manipulation. And finally, I also learned about how HTML, CSS, and JavaScript worked together to create a functional and attractive webpage. The challenges that I encountered are to organizing the semantic structure, arranging the features properly, creating a circular theme switch button with an icon while keeping it functional. I also had difficulty making the changes in the JavaScript without affecting the HTML, CSS and the overall design. I solved it by testing my webpage several time and adjusting the HTML, CSS, and JavaScript step by step. I also changed the layout and styling until I am satisfied and making it functional and user-friendly. The improvement I made was redesigning the theme switch button into a simple circular button with an icon while keeping its dark and light mode functions working properly.
