

WEEK 7_REFLECTION

I learned about is the node.js to create the backend of a web application. A first, I was not very familiar with node.js, Express, and MongoDB, but as I followed the activities, I slowly understood how they work together, I also learned how to create a project online using Render. This helped me understand more about how a website works behind the scenes. The Challenges that I encountered was downloading and setting up Node.js, creating the project structure, connecting to the database, and deploying the project to the render. I found these parts difficult because there were many steps to follow, and one small mistake could cause an error. I was also confused at first about where to put the different files and how to properly connect them together. I solved the challenges by following the instructions carefully and checking my work step by step. When I encountered errors, I tried to understand what caused them instead by giving up. I also went back to the previous steps and checked my files and code. After trying several times, I was able to make the project work. The improvement is making it worked and before this activity I am not sure how the backend worked, but now I have a better idea of how fronted, backend, and database communicate with each other. I also become more patient when solving the errors because I leaned that making mistakes is part of learning the lesson.
