

WEEK 3_REFLECTION

I learned about html file and linking it to the CSS file it is for designing the website to make it better. I also learned about the CSS and what is it inside such as the body, header and navigation, main content, form styles. Footer and the responsive design. The challenges that I encountered are to

combine and design properly to make it a good and organized design for the website I solved by testing the code, and checking the website look like in the browser and making changes to the CSS until I was satisfied with the design. The improvement that I made is making the website more organized and visually appealing by adding the proper styling, spacing, and a responsive design.
